

# test-network-k8s

*Fabric, Ahoy!*

Hyperledger Fabric Contributor Meeting – October 13, 2021

Josh Kneubuhl - [jkneubuh@us.ibm.com](mailto:jkneubuh@us.ibm.com)

What:

[Test Network](#) for Kubernetes

# Why?

- Simple setup : *single action*
- Simple recipe for HLF development : *local = cloud*
- Fabric Kubernetes guide : *lost at sea...*

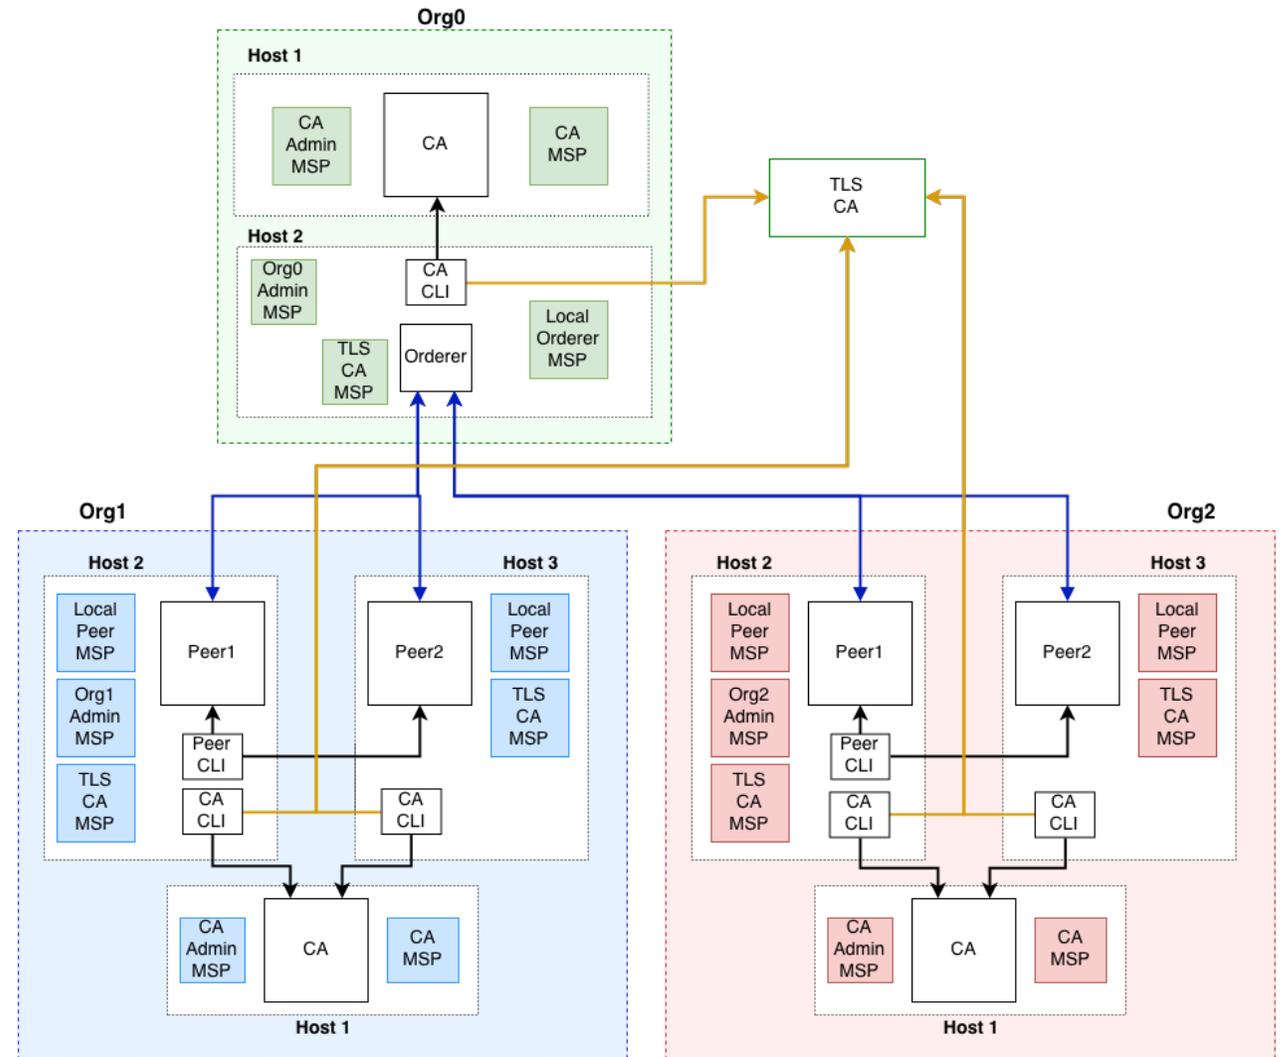

# How?

- Everything runs in containers.
- Everything runs on Kubernetes.
- No Kube? No prob - everything runs locally. *KIND*
- Transition to *Chaincode-as-a-Service*. *! docker.d*

# Turbulence?

## Realistic CA Deployment:

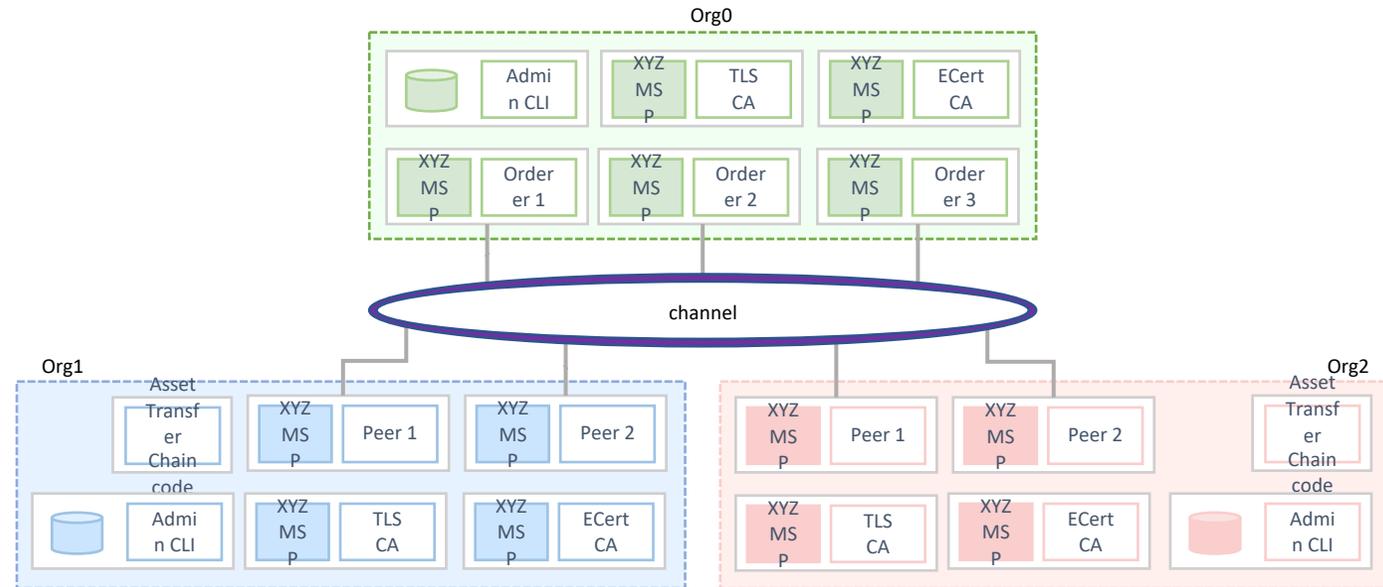

- CA bootstrap is finicky
- fabric-ca-client -> MSP folders
- Consortium Organizers *distribute MSP*
- Includes both TLS and Org CA

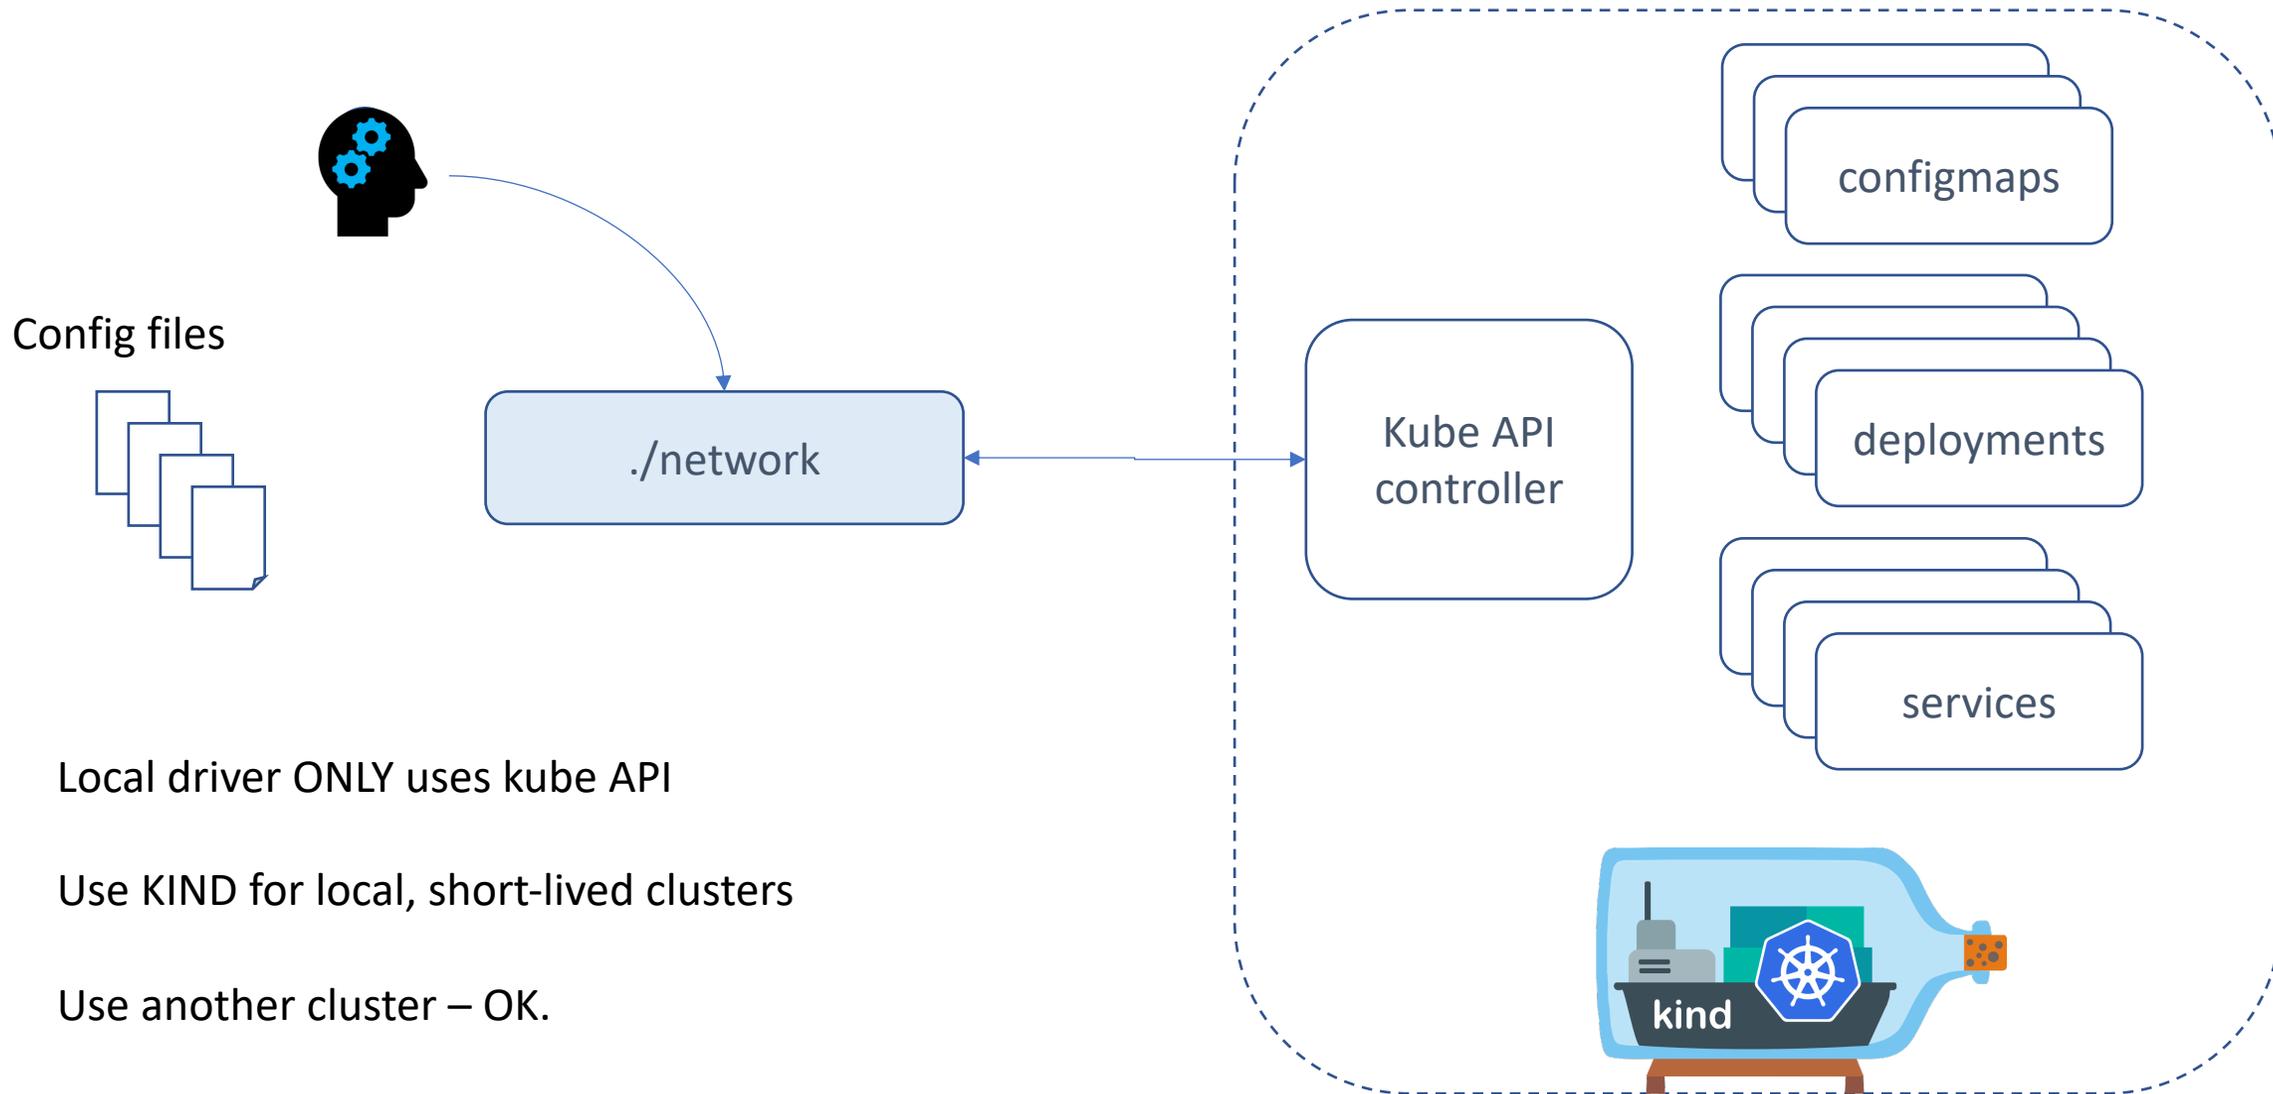

“Noone understands HLF certificates...”

## Kube Test Network

- Twelve Enrollments
- Six CAs
- Four Peers
- Three Orgs
- Three Org Volumes
- Three Org Admin CLIs
- Three Orderers
- Two Smart Contracts
- One Channel
- One Sample Client App
- One Gateway Client App

Local driver ONLY uses kube API

Use KIND for local, short-lived clusters

Use another cluster – OK.

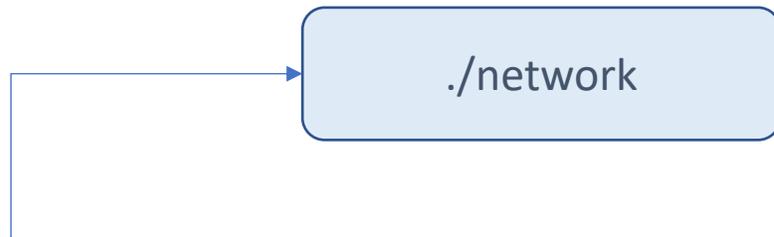

Live Demo

# Scenarios:

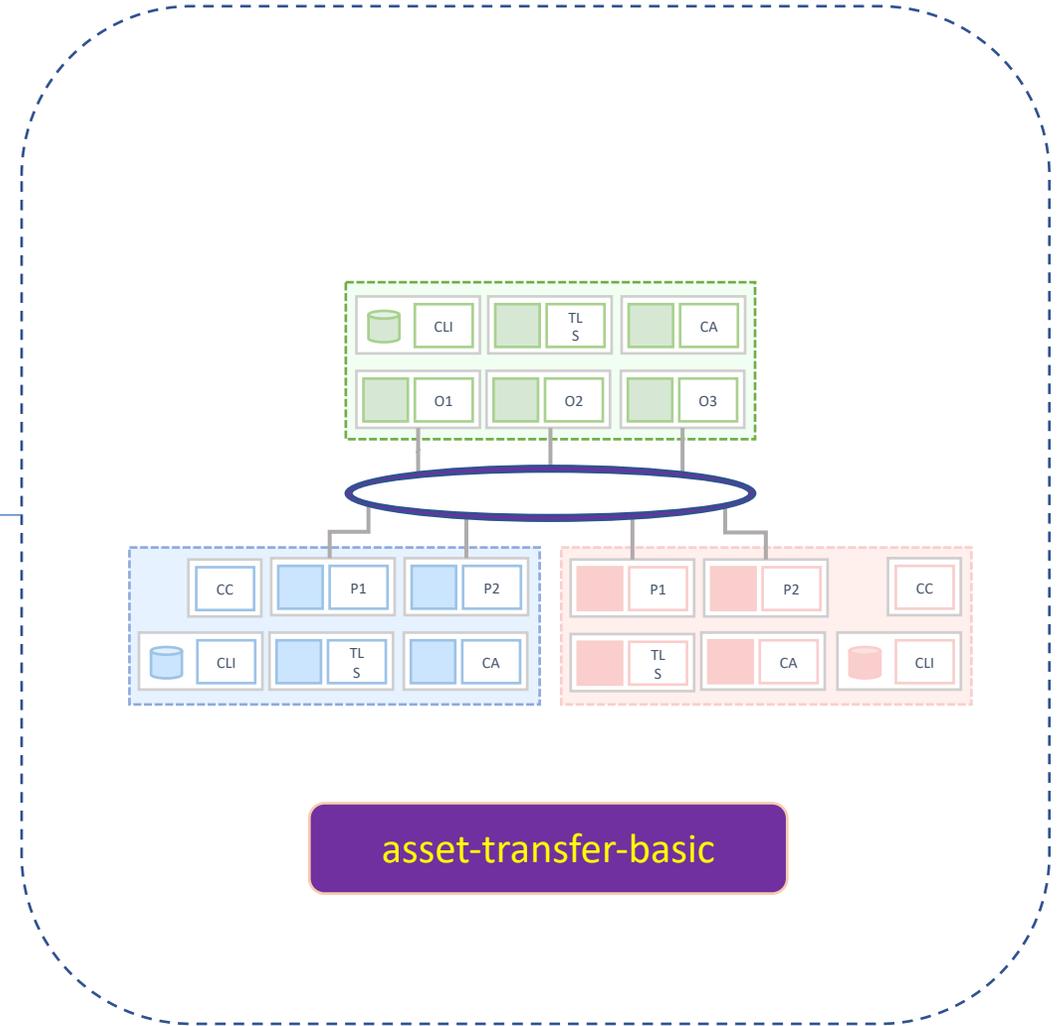

- Test network on KIND
- Fabric Client on KIND
- Custom chaincode
- Debug chaincode!
- Test network on Cloud
- Fabric Operations Console

# Test Network on KIND

```
export TEST_NETWORK_FABRIC_VERSION=2.4.0-beta
```

```
./network kind  
./network up  
./network channel create  
./network chaincode deploy  
./network chaincode invoke  
./network chaincode query
```

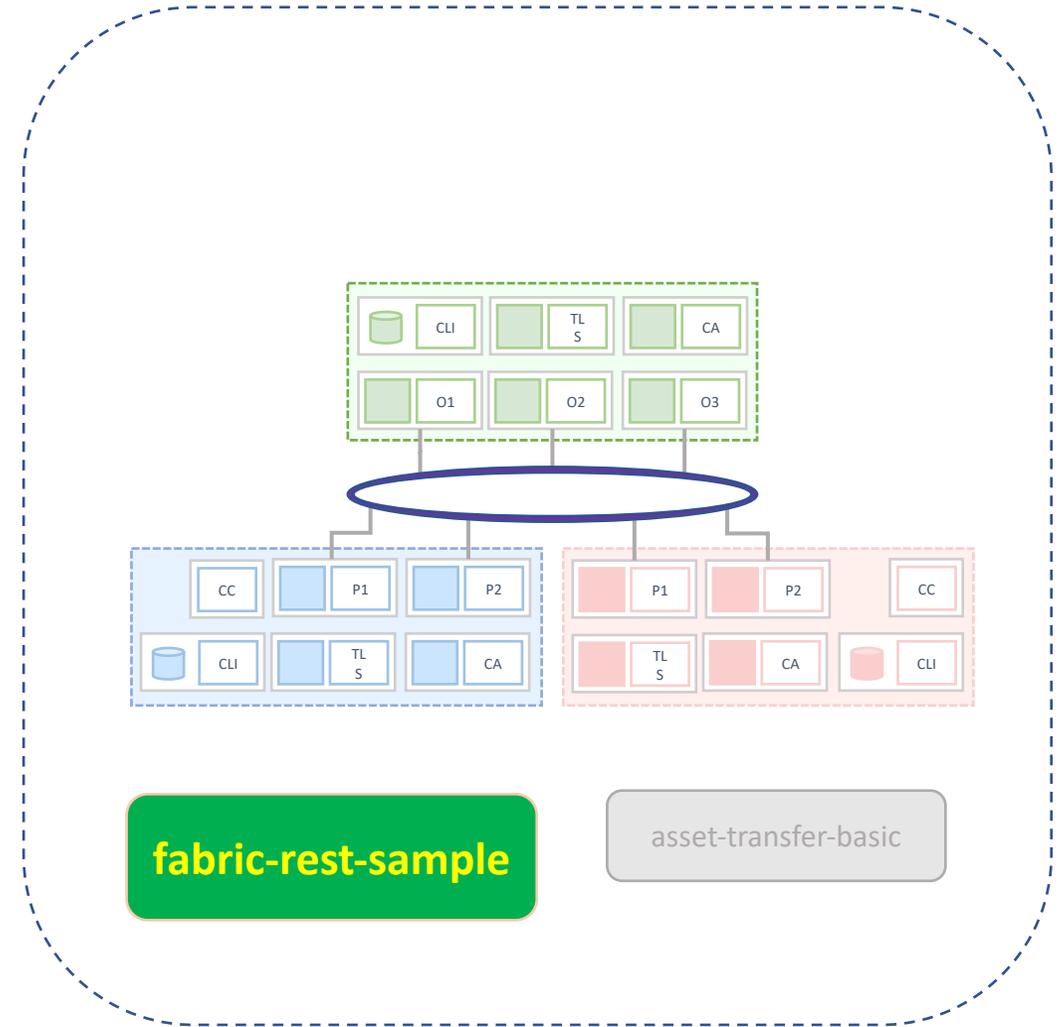

# rest-sample on KIND

./network

```
./network rest-easy
```

```
export ACCESS_KEY=<guid>  
curl localhost/api/assets
```

NGINX

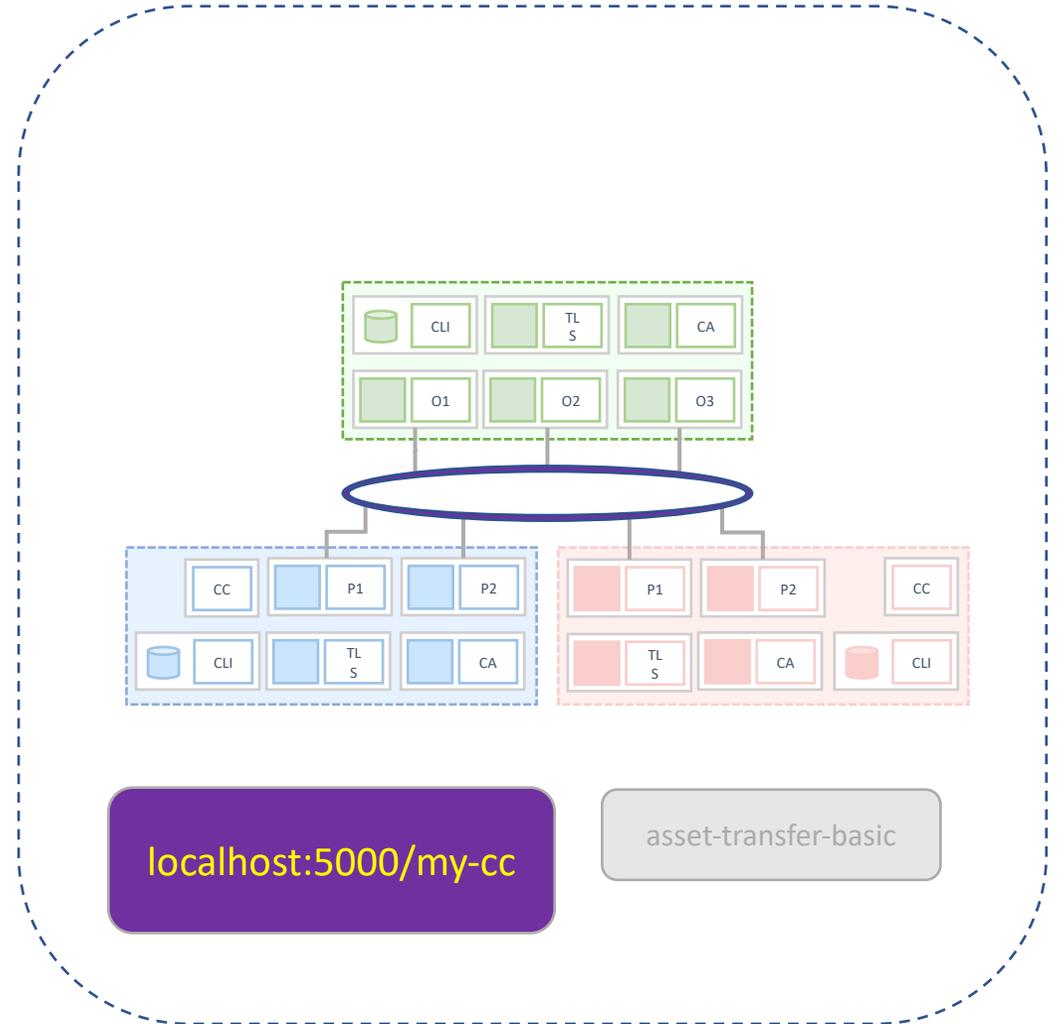

# Custom Chaincode

./network

```
export TEST_NETWORK_CHAINCODE_IMAGE=localhost:5000/my-cc
```

```
vi assetTransfer.go  
docker build; docker push
```

localhost:5000 container registry

# Debug Chaincode

localhost:5000/asset-transfer-basic

```
export TEST_NETWORK_CHAINCODE_NAME=debug
```

```
vi assetTransfer.go
```

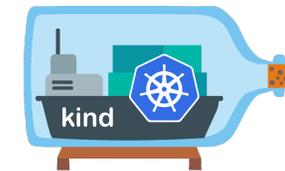

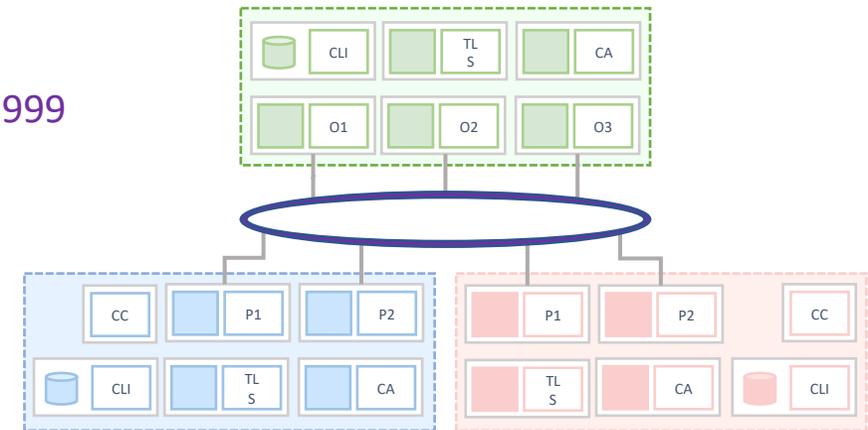

```
docker build
```

```
network chaincode install
```

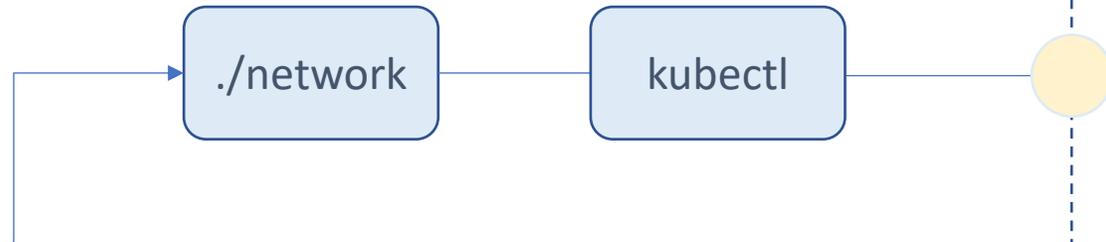

```
docker run -e CHAINCODE_ID -p 9999:9999 my-cc
```

```
network chaincode activate
```

host.docker.internal:9999

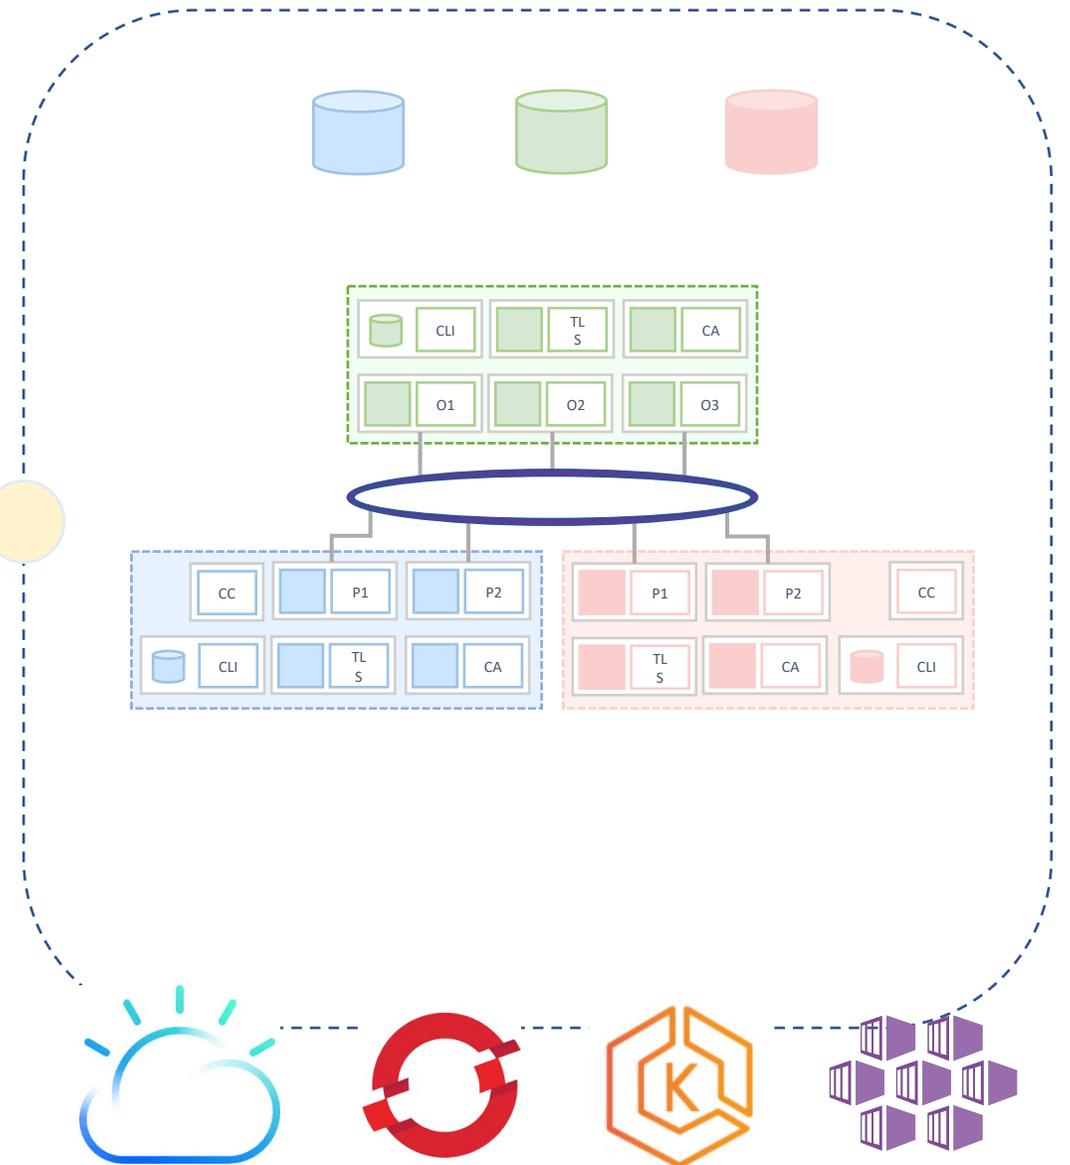

# Test Network on Cloud

## ~~./network kind~~

- `./network up`
- `./network channel create`
- `./network chaincode deploy`
- `./network chaincode invoke`
- `./network chaincode query`

# Rough Edges

- Needs time to “settle”
- Mutual TLS
- Chaincode TLS
- Intermediate CAs
- Time-bomb Certificates
- Docs, samples, ???

# Key Outcomes

- Debug locally ... Deploy to cloud
- Local Dev = CI/CD = Test = Q/A = Prod
- Zero investment clusters
- Predictable, Portable, 100% reproducible:
  - External CC Builders on Kubernetes
  - Cross-Namespace Kube DNS and CSRs
  - *5x orderers*
- Call for community alignment:

+/- secrets, ledger

New patterns (CI/CD, test, ??)

*“What’s wrong with XYZ?”*

**Kubernetes SIG**
