17:09:22 From Alex Ivan Howard to Everyone:

Indeed, thanks Elizabeth.

17:16:38 From Elisabeth Green to Everyone:

Is it ethical to allow carbon trading?

17:18:11 From Elisabeth Green to Everyone:

This "ecological footprint" is not comprehensive because it does not include the other aspects of an "environmental footprint"

17:54:43 From Elisabeth Green to Everyone:

Environmental footprint = ecological footprint = social footprint (which might be divisible into ecological components, e.g., the epigenetic forces that cause: some of the overpopulation that multiplies emissions; and some of the healthcare that causes emissions) Thus, a charismatic narcissist could induce mob mentality that could lead to 50 couples each bearing a live infant in a developed country or an ecologically-equivalent outcome of 3,660 Transatlantic flights per year. For example, PG&E caused three major fires in California which killed approximately 88 people. The owners of the destroyed property have claims against PG&E for the value of the damage to their property. The survivors of the 88 dead may have claims against PG&E for the lost services. The People of California have claims for the air quality damages that lead to healthcare services but also may benefit by the decrease in the emissions that would have been caused by the 88 dead if they had survived.
