Iroha is a distributed ledger project, that aims to provide a development environment where C++ and mobile application developers could contribute to Hyperledger. The project seeks to complement Fabric, Sawtooth, and other potential projects, being a framework with pre-defined set of commands, permissions and queries that can be used with various client libraries to easily create applications for desktop and mobile platforms.

Iroha is inspired by Japanese Kaizen principle — eliminate excessiveness (muri). Iroha has essential functionality for asset, information or identity management, at the same time being an efficient and trustworthy byzantine fault-tolerant tool for your enterprise needs.

**Key Characteristics**

Permissioned network; written in C++; Client libraries in Java, Python, JS, Swift; BFT consensus algorithm YetAnotherConsensus (YAC); ready-to-use set of commands and queries, Multi-signature transactions.

**Project Management**

Proposals can be created in Jira or suggested and discussed in chat. Those who can implement the proposals then write the code. If people want to know what to work on, they can ask in a special contributors chat or create an issue to get attention. Github projects are used to manage release versions.

**Repositories**

- iroha (core project)
- iroha-ios (iOS SDK)
- iroha-android (Android SDK)
- iroha-javascript (JavaScript SDK)
- iroha-python (Python SDK)

### Examples of additions for this page - based on Sara Garifullina request to enliven the page:

- Task lists can be assigned user etc.
- This is already in use for pages for validating an action is complete

**Example Poll**

@KellyCooper for poll request additions

---

**Yes, this location works for a poll**

**No, arrange for a poll to be added to the template**

**I think it would be great if we move it to the pool example page and then**

Also, charts, galleries, roadmap planner, etc. If you have data or content I can mock up.
