

Iroha 2

Iroha is a straightforward distributed ledger technology (DLT), inspired by Japanese Kaizen principle — eliminate excessiveness (muri). Iroha has essential functionality for your asset, information and identity management needs, at the same time being an efficient and trustworthy crash fault-tolerant tool for your enterprise needs.

Features

Iroha has the following features:

- Creation and management of custom fungible assets, such as currencies, kilos of gold, etc.
- Management of user accounts
- Taxonomy of accounts based on domains in the system
- The system of rights and verification of user permissions for the execution of transactions and queries in the system

Navigation

The main inspiration for Iroha 2 described in the [White paper](#).

User guides and good information to start placed on [Read the Docs](#).

[Confluence pages](#) of Iroha 2 provide you with information about software development related aspects:

- [Product requirements](#)
- [Requests for Comments](#) and [Architecture Decision Records](#)
- [Meeting notes](#)

[Github repository](#) contains developers oriented information about builds, tests, contribution to project and usage of project inside your projects.

Contribution and Requests

Every new feature should go through the following steps:

1. [Requests for Comments](#) is created and filled according to the instruction
 - a. All stakeholders commented or wrote a comment that they do not have anything to add or time to comment
 - b. Decisions, Assumptions and all other Solution's sections filled
 - c. Status changed to "Completed".
2. RFC moved to the [Architecture Decision Records Log](#)
 - a. Requirement placed into the table [Needs and Requirements](#) with reference to the RFC
3. Issues and Epics created in [Jira](#)
 - a. All issues linked back in the table [Needs and Requirements](#)
